SKILLS TRACKED

06

HELD BY THREE OR FEWER

THE PROBLEM

Skills data sits in different places,
so a simple question has no answer.

*“If the person who knows the ammonia system leaves,
who else can do it?”*

Today that takes phone calls to three plants. It should take one click.

WHAT THE DATA SHOWS

Six skills are held by three people or fewer.

One of them is held by a single person, at the Marshall R&D centre. If that person leaves, frozen dough formulation leaves with them.

A skill known by one person is not a statistic. It is a production risk with a name on it.

1	R&D, frozen dough
	Marshall, MN R&D centre
2	Ammonia refrigeration
	Marshall, MN ice cream
2	Food labeling rules
	Hopkins, MN corporate
2	Salina line setup
	Salina, KS pizza
3	PLC automation
	Salina, KS pizza
3	Culinary consulting
	Field, national

Most dashboards show numbers and stop. This one puts them in an order of work.

How much it hurts	How few hold it	How big the gap is
impact if the knowledge is lost	one person, or a handful	distance from where it needs to be

01	R&D, frozen dough	One person holds it. Pair the expert with two mentees.
02	Food labeling	Two people. Run a cross-border labeling workshop.
03	Ammonia refrigeration	Two people, both near retirement. Sponsor certification now.
04	Salina line setup	Two people, nothing written down. Write it down, then mentor backups.

THE OTHER SIDE OF IT

The challenge says employees close skill gaps.

So one screen speaks to the employee, not only about them. Same data, same saved state as the manager's view.

TEN FIRST STEPS, SIXTEEN BACKUPS, ACROSS ALL FIVE METHODS

8	Training
6	Mentoring
5	Project experience
4	Certification
3	Job rotation

SEEN FROM THE OTHER SIDE

Sam K.

Refrigeration technician, Marshall. Fourteen years.

One of two people who hold the ammonia certification, so his step is to pass it on.

He ticks the same box his manager sees. The manager starts the plan, the employee sees it, and the count in the corner goes up.

NUMBERS FROM Demo profiles. Methods are the five the challenge names.

Four files. No framework, no build step, nothing loaded from the internet.

Every outside number is sourced, and three claims were cut after checking because they only traced back to blogs. FACTS.md lists all of it.

Are these real numbers?

Coverage and headcounts are demo data. Sites, job groups and the regulations are sourced.

Where would the data come from?

Training records, certifications, maintenance sign-offs. OSHA keeps the ammonia roster by law.

How is the order decided?

Impact, times how few hold it, times gap size. The formula is on screen.

Did you use AI to build it?

Yes, the rules allow it. The architecture is mine and I can explain any line.

THANK YOU
